Hi,

```
FileSel f;                      // create a FileSel object
f.ActiveDir(".");                 // set folder to look in
f.Type("Text file", "*.txt;*.log");  // set file types to filter
f.ExecuteOpen("Select a text file");// display the File Selection dialog
String fs = f.Get();               // get a file name
String s;                       // create a String object
s = LoadFile(fs);                 // load the file into a string
mydocedit1.Set(s);                  // display the file in a DocEdit control
mylineedit1.Set(s);                // display the file in a LineEdit control
```
