Hi,

```
FileSel f;           // create a FileSel object
f.ActiveDir(".");   // set folder to look in
f.Type("Text file", "*.txt;*.log"); // set file types to filter
f.ExecuteOpen("Select a text file");// display the File Selection dialog
String fs = f.Get(); // get a file name
String s;          // create a String object
s = LoadFile(fs); // load the file into a string
mydocedit1.Set(s); // display the file in a DocEdit control
mylineedit1.Set(s); // display the file in a LineEdit control
```
