I am not totally sure about the best behaviour. If you run ScatterDraw_demo_cl, you will get from this vector

```
s1 = {{1,14}, {2,65}, {3,29}, {Null,Null}, {5,40}, {6,50}, {7,Null}, {8,25}, {9,10}};
```

this plot

If `x == y == Null`, plot line jumps, but if just `y == Null`, a hole is created.

What would be the best behaviour?
