I am not totally sure about the best behaviour. If you run ScatterDraw_demo_cl, you will get from this vector

 $s1 = \{\{1,14\}, \{2,65\}, \{3,29\}, \{Null,Null\}, \{5,40\}, \{6,50\}, \{7,Null\}, \{8,25\}, \{9,10\}\};$ this plot

If x == y == Null, plot line jumps, but if just y == Null, a hole is created.

What would be the best behaviour?
