arixion wrote on Wed, 25 October 2006 22:11 what sort of files are all these settings saved in?

Source code related stuff in .upp file (inside package directory).

Build method settings in .bm files (inside theide directory in Win32).

Anyway, both can be fully setup in TheIDE.

Quote:

I notice they are not present in \*.upp files?

Those set for the package are. But note that adding compiler options for package requires usually When condition because package can be compiled with various compilers.

Quote:

Btw, how do you add a new build method?

Setup / Build methods, right click on left pane, select New.

Quote:

Is it possible to call the same compiler (e.g. GCC) with 2 different sets of flags, and toggle between these two sets?

Yes. That is what build methods are for
