Hi,

Thanks to Mirek, this revised code is better.

```
FileSel f;           // create a FileSel object
String curdir = GetCurrentDirectory(); // get the current folder
f.ActiveDir(curdir); // set folder to look in
f.Type("Text file", "*.*"); // set file types to filter
f.ExecuteOpen("Select a text file"); // display the File Selection dialog
String fs = f.Get(); // get a file name
String s;           // create a String object
s = LoadFile(fs); // load the file into a string
mydocedit1.Set(s); // display the file in a DocEdit control
mylineedit1.Set(s); // display the file in a LineEdit control
```
