Hi,

Thanks to Mirek, this revised code is better.

```
FileSel f;                // create a FileSel object
String curdir = GetCurrentDirectory(); // get the current folder
f.ActiveDir(curdir);      // set folder to look in
f.Type("Text file", "*.txt;*.log"); // set file types to filter
f.ExecuteOpen("Select a text file"); // display the File Selection dialog
String fs = f.Get();       // get a file name
String s;                 // create a String object
s = LoadFile(fs);         // load the file into a string
mydocedit1.Set(s);        // display the file in a DocEdit control
mylineedit1.Set(s);       // display the file in a LineEdit control
```
