Hello

when I test the sqlite3 at reference/SQL\_sqlite3, I found a question about ChangePassword() function.

Step 1: Use sqlite3.Open(file, "password") create an encrypted db file.

Step 2: Use sqlite3.ChangePassword("password\_changed") change the file's password.

Step 3: Use sqlite3.Open(file, "password\_changed") to open the db again.

The problem occurred in the third step, when I opened the db file with changed password, that failed about "ERROR file is not a database(26)".

I am not familiar with encryption. Can anyone test and answer this question?

Thanks.

1. create a encrypted file.

2. change password

3. use newpassword open failed.
