Helo

when I test the sqlite3 at reference/SQL_sqlite3, I found a question about ChangePassword() function.

- Step 1: Use sqlite3.Open(file, "password") create an encrypted db file.
- Step 2: Use sqlite3. Change Password ("password_changed") change the file's password.
- Step 3: Use sqlite3.Open(file, "password_changed") to open the db again.

The problem occurred in th third step, when I opened the db file with changed password, that failed about "ERROR file is not a database(26)".

I am not familiar with encryption. Can anyone test and answer this question?

Thanks.

- 1. create a encrypted file.
- 2. change password
- 3. use newpassword open failed.
