Hi,

in others package this not occur!

after a review in assembler editing there was a reference to the folder "C:\U++\bin\clang\include" which probably blurred all logic! As soon as I removed it, the error in the Core/Defs file disappeared!

This package where the error was displayed was for general testing and for some reason that I don't remember now, what was the reason for directly accessing this folder. Anyway anyway By accessing a "source location", the IDE can add due attention to its "tips"!

Thanks!
