Hierarchical Data Format (HDF5) is a file format designed to store and organize large amounts of data.

HDF libraries allow to handle this format.

Hdf5 U++ UppHub wrapper is a basic C++ wrapper for Hdf5. The library itself is included in plugin folder, so any library accessible by an U++ software, like MatIO, can use them.

A simple sample of the wrapper and of the library itself is included in examples/Hdf5_demo_cl package.
