Hi Victor

I am surprised. I have reduced your sample to the minimum, but I cannot answer why
TabControl::WhenSet() is called when the window is closed.
I would be grateful if someone could lend a hand.

```
#include <CtrlLib/CtrlLib.h>

using namespace Upp;

struct Test: TopWindow {
    TabCtrl tabs;
    StaticRect tab0, tab1;
    Test() {
        Add(tabs.SizePos());
        tabs.Add(tab0.SizePos(), "Tab 0");
        tabs.Add(tab1.SizePos(), "Tab 1");
        tabs.WhenSet = [&] {PromptOK(Format("Tab %d set", tabs.Get()));};
    }
};

GUI_APP_MAIN {
    Test().Run();
}
```
