This looks like it works:

```
int AdjustForTabs(const String& text, int col, int tabSize) {
    int pos = 1;

    for (int i = 0; i < text.GetLength(); i++) {
        if (text[i] == '\t') {
            int newpos = (pos + tabSize - 1) / tabSize * tabSize + 1;
            col -= newpos - pos - 1;
            pos = newpos;
        }
        else
            pos++;
    }

    return col;
}
```

```
String text = editor.GetUtf8Line(line);
col = AdjustForTabs(text, col, settings.TabSize);
```

I'll test it for a few days then write a Utf8 friendly version.
