fallingdutch wrote on Sun, 29 October 2006 02:22Well for a fast hack change the line

```
class TrayIcon : private Ctrl
```

```
to
```

```
class TrayIcon : public Ctrl
```

```
then it should work.
```

@others

Why is Ctrl a private base-class of TrayIcon? I guess to hide some functions like SetRect etc - in that case it would be great to add SetTimeCallback to TrayIcon.

Bas

Because Ctrl is used just as implementation helper. TrayIcon really is not Ctrl.
