Hi folks.

I have a problem with saving a paletted png image. From looking in plugin/png it seems that it is actually handling paletted images, but I always end up with a 24bit png. The problem seems to be PixelArrayToImage which converts my PixelArray (8bpp) to a Image.

I have tried without success to create a Draw that will maintain the paletted format.

Can anyone help me out here, I'm not sure if the support is there or if I need to do some hacking.

Any clues/pointers would be very much appreciated.

I need the exported png to be paletted!

Thanx, Tomas
