Subject: Shell variable substitution in package configuration flags

Hello,

I've seen that shel variables are not substituted when entering, for example, flags in package organizer.
I have some libraries that set the install path there, and I would like to set, for example, "-L$(BRXSDK)" instead or hard coding the path in package organizer (which would make useless the package's deploy)
or entering the whole stuff in build methods fields (which imho it doesn't belong).

Is it possible to add this feature ?

Ciao

Massimo
