Well, going to libclang comes with price - I do not already have control over bad installations. This is clearly one of those case where something happened to include path.

Mirek

Hmm, but why would it be a bad install? It is a fresh U++ RC install.

I will keep an eye on it...

Well, it is a conjecture at this point, but in the past these kinds of bugs were invariably caused by libc++ headers being different version than libclang or some similar sort of mismatch / incompatibility in linux packages. So I do not mean bad U++ install, but bad LLVM install.

Obviously if you look at errors, all starts with libclang not knowing some types it definitely should know...
