Was not a priority so far. Can be done I think, we already have all pieces ready (rectangular selection, paste in column). Keep asking and it will happen.

I keep asking, occasionally :) :

Anyway, the multiline edit mode doesn't need to be activated by that selection box - it was just an example image as I couldn't find anything better.

When you want to edit multiple lines at once in Visual C++ or Notepad++, you just press Alt+Shift+Down or Up arrow so the cursor is extended to another line(s).

Then the text is entered to all lines where the cursor is as you type it in.

Michal

This is already the same in the IDE. The only difference really is that a) cursor is not blinking over the whole height b) if you start typing, it behaves differently (and frankly quite badly, so the change will practically be a fix).
