I think, COM-server is easier to connect with System.Reflection Namespace of C#.NET, as well as in VB - COM is easier to connect just referencing to the component that is installed in your OS. If any .lib/.dll/pluging with Reflection stuff for COM could once be added to UPP - only in such a case COM usage in development could become more comfortable, I think. Now, COM is really unpopular to call it in C++ (as it is itself written in c/c++) - can just use COM to dynamically load to higher level languages.

p.s.

some c++ reflection - link from here
