

Hi,

As a follow-up to the WebDAV package, I'm pleased to introduce the CalDAV package.
It is available via UppHub.

From the README:

CalDAV Package for U++

A lightweight, RFC 4791-compliant **CalDAV client** for U++.
Implements calendar discovery, event management, and scheduling operations over
HTTP/WebDAV protocol.

Features

- **Full CalDAV coverage**: discovery, event retrieval, creation, update, and deletion
- **Dual operation modes**: blocking and non-blocking
- **Built on WebDAV**: extends ``WebDAVRequest``, inheriting all HTTP functionality, including SSL, authentication, and redirection
- **Simple U++ API**: clean, self-contained interface using familiar U++ conventions

Supported Operations

- **Principal and home discovery**: ``GetCurrentUserPrincipal``, ``GetCalendarHomeSet``
- **Calendar collection discovery**: ``GetCalendars``
- **Event retrieval**: ``GetEvents``, ``GetEvent``
- **Event modification**: ``AddEvent``, ``UpdateEvent``, ``DeleteEvent``
- **Non-blocking variants**: all ``Start*`` methods correspond to blocking calls

Examples

Name	Description
-----	-----
CalDAVExample	Demonstrates connecting to a CalDAV server, listing calendars, and adding events

A CardDAV package will follow.

Best regards,
Oblivion
