Hello!

Just to be sure, I’m starting a separate thread so it doesn’t get overlooked ;)
I’d like to report an issue with the HTTPS example from the reference:
1. First issue – the attached certificates have been invalid for some time now.

2. Even after connecting new valid certificates (self-signed), when I enter https://localhost:4000 into the browser, an error message appears in the browser window:

The localhost server is using an unsupported protocol.
ERR_SSL_VERSION_OR_CIPHER_MISMATCH

And in the application logs:

Connection accepted
SSL handshake failed: socket(568) / SSL handshake: Unknown error code.
================================================== Waiting...
