I have tested another, and this it comes out to me well. I take the feasible one with execl, of this form:

```
void onLaunchExe()
{
   String exe = "/media/GIGANTE/DSRLLO/upp/out/GCC32.Debug_full.Gui.Shared/testDLL_EXE";
   int status;
   pid_t pid = fork();
   if (pid > 0)
   {
      execl( exe, exe, " This is all, folks!!!", NULL );
      // I hope to wait to secondary program finish ...
   }
}
```

In this case the both windows works fine, but this was not what I wanted to obtain.

Perhaps now we have more data to find out what happens with this problem.
