Hi!

I have no problem with turning the socket opening functions into methods although I don't see much that's to be gained here. The internals of the socket implementation (i.e. the `Socket::Data` class interface) has to be exposed at least to the Web/SSL module anyway so a reduction in the number of files used by the socket packages doesn't seem to me very likely. It would also prevent inline definition of many interface methods. The only long-term result seems to me blocking the socket class against possible future extension to other socket-like data interchange channel accessors.

Regards

Tomas
