Suggestions for navigating source code :

Jump to definition of word under the cursor; then pop back to where you were. This needs a stack. TheIDE already has some jump to definition capability so maybe one day ...

Another useful thing is the ability to jump back to the last place where you made an actual change to a source file - e.g. if you move to another place in the file to copy a name or something, with a single keystroke you can get back to where you were last doing an actual change.
