I was just curious, as both worked fine, and produced the same result, I just didn't know what was the diff.

Actually, somebutton << THISBACK(Press) does work!

class Ctrl has these operators:

```
Callback operator<<=(Callback action) { WhenAction = action; return action; } Callback& operator<<(Callback action) { return WhenAction << action; }
```

I tried this:

somebutton << THISBACK(Press) << THISBACK(Press2) << THISBACK(Press3) << THISBACK(Press);

The handlers were called in this order: Press, Press2, Press3, Press

So with <<, I can add multiple callbacks. That's nice.
