In-code comments tend to be pretty helpful, also the reference generated from it. doxygen is exceptionally good at this.

Maybe consider using it in Upp base source?

As a side note, Assist++ is the very first code-completion feature I have seen in ALL IDEs so far, that really assists in development, and not hinders (I had to turn these things off in other IDEs)!

Assist++ is a GREAT help for me as a beginner, and I think, that by using doxy style docs, Assist++ could even display the /brief of the given function/class, while moving through the available selections. That would be a mighty fine thing! I haven't seen this anywhere yet!
