Use FindFile.

```
FindFile ff(AppendFileName(mydir, "*.*"));
while(ff) {
    ... you get the name in ff.GetName() and attributes in other methods
    ff.Next();
}
```

FileSystemInfo is most likely a overkill here - it is useful for very specific situation as virtualisation of filesystem. Typical use is using FilSel to browse directory on some else computer connected via TCP/IP (only).
