
Subject: About string, String and const char *

Well, I have just down an interesting investigation (because of some discussion thread in comp.alt.c++.moderated) which also nicely explains why in U++ we are using "const char*" instead of String so often.

```
#include <string>
```

```
void foo(const std::string& x);  
void foo2(const char *s);
```

```
void Test1()  
{  
    foo("just a test");  
}
```

```
void Test2()  
{  
    foo2("just a test");  
}
```

Now Test1 has 115 bytes, Test2 12 bytes... (and it is similar for String too).
