luzr wrote on Mon, 01 January 2007 18:18 Well, dialogs are zoomed because the size of font is different (Everything is defined relative to choosen base font, then scaled up for actual font).

The right thing to do is to design your widgets so that they do not care.

Mirek

Yes, I know the real size is determined by the system default font.

I havd read it in document "Logical positions."

Quote:

Zoom factor is determined by ratio of text "OK Cancel Exit Retry" in runtime standard font size to Size(99, 13) - size of this text using standard font.

However, in the layout tool of TheIDE,  
the size of controls are assigned in

LeftPosZ(16, 108).TopPosZ(20, 36)

There are "Z" postfix in there functions,  
which means the size of there controls are "Zoomed".

Is it possible that, the wrong size is caused by the numerical error of the integer divide operation?
