About CJK font.

I try to enumerate font from VS.NET 2003.

The `lfFaceName` gave the same result compared to Ultimate++

the result memory value are 0x82, 0x6C, 0x82, 0x72, 0x20, 0x96, etc for Ms PMincho, unfortunately
Ultimate++ cannot render this value.

For VS.NET 2003, it also cannot render this value unless we set the character set option to "Use
Unicode Character Set".

So may be this give some clue.
