Subject: floating table and pagebreak

Hello,

I need to save in a QTF document several tables. All the tables have the same size but the height is not fixed depending by many factors and data inside. In other words I can't easily figure how many tables there are in a page. Moreover I want to prevent that a table is splitted on two pages. To this end should be nice a command that force the table to stay on an entire page forcing a page break when needed. Is there such option?

Thank you,
Luigi
