- since chameleon refactoring, application font is grey instead of solid black.
- the xfce4 theme-engine works with or without the clearlooks work around.
- I can't create build methods: typing "GUI MT SHARED" results in an empty combo box after closing the dialog. I install upp sources in /usr/local only now, if that matters
- the debian package doesn't ever work on debian, so please include "ubuntu" in the package name, to save people from wasting time

Guido
