I've installed Upp without problems on slackware 10
but when I tested it: by trying to build the 'HelloWorld' example; it failed to find the
"fontconfig/fontconfig.h" header.

Failing a simple direct solution to the above, where can I find:

- (1) a description of the enviroment requirements for Upp,
- (2) a list of default directory structure that Upp expects,
- (3) what you think I should also know..

Thanx
