attached is an experimental Gentoo ebuild for upp-2007.1_beta3.

A couple of notes:

This ebuild does not pass repoman due to the size of the replacement ide/Makefile which has been copied into the files directory. The ide/Makefile also needs a bunch more cleaning up to remove the hard-coded X11 includes and libraries. I am trying to do this without having to resort to generating full automake/autoconf makefiles.

The beta3 ebuild installs into /opt/upp to keep from cluttering up /usr (this will change once the portage overlay is stable).

Untar the attached portage overlay and follow the couple of instructions in the upp-porate/Notes file.

It is still rough, but with any luck should build rather easily.

Happy compiling
