Subject: working on Makefiles

I started looking at the "Create makefile" build tool source and setup in an attempt to fix the autogeneration of Makefiles on *NIX machines. I have a question on how, if possible, to run a configuration script in the package organizer.

For example, I need to run (at some time) the following scripts:

Draw Package's libraries:
  LINUX | `pkg-config gtk+-2.0 --libs`
  LINUX | `pkg-config x11 --libs`
  LINUX | `freetype-config --libs`

... similar settings for CFLAGS (variable CINC), etc.

Can the package organizer run a configuration script? If so, how? If not, can we add this functionality? Justification -- running pkg-config, etc., is the defacto standard way of getting to this info, and would *possibly* keep us from having to hand modify the resultant Makefile for theIDE.
