ebojd wrote on Wed, 07 March 2007 20:02How different is your Makefile changes to the one I just posted?

I only added pkg-config cflags to CINC:
CINC = -I$(UPPDIR1) `pkg-config --cflags gtk+-2.0` -I/usr/include/freetype2
and added the line:
LINKOPTIONS = `pkg-config --libs gtk+-2.0`

It's only a temporary hack to get it compiled, since I can't figure out a how to do this in the GUI.
The upp documentation for building is outdated und no longer applies.
I'm not much interessted in hacking the Makefile, since I expect to be able to build from TheIDE.
lsb-rpm integration some time in a future would be nice too.
