... Let's go to buy a new pendrive...
Luigi

Bad news,

The distro works great in a usb pendrive and even my application build somewhere else run correctly in the Puppy distro. It seems there is a big community around it.
I've downloaded the latest Upp but it was without an executable. I tried to run the makefile without success (it creates many directories but no compilation at all). This is normal I think because of different setup.
So I tried to get Thelde from a previous dev version but it do not run. Unfortunately no message appear. Perhaps some missing library.
I need to inquire it better.
For the moment I'm Uppset, as EBo would say,

Luigi
