In U++/Win32 you can call "InstallCrashDump" at the start of program. This will create the core dump that can be later analyzed in "Crash" utility (you should be able to compile it from uppsrc). So if you have any difficulty analyzing, you can try this. Crash will need "*.crash" dump file and map file of executable.

Mirek

Hello,

I'm having the same problem for linux (crashes in optimal mode and works in debug mode). Is there some support for linux? I've tried to add "InstallCrashDump" (<Core/Diag.h>) but I get error from gcc. It seems this is very specific Win stuff.
