Subject: GCC.bm problems
Posted by ebojd on Thu, 22 Mar 2007 14:09:42 GMT

There continues to be problems with the GCC.bm file missing from the source distribution.
Looking at the structure of the file I surmise that it sets up various configuration *stuff*. I have the
following questions and comments:

 *) how is it generated?
 *) when is it supposed to be generated?
 *) how does it become "stale" or out of sync?

Having this break installation should be addressed IMNSHO...
