ebojd wrote on Thu, 22 March 2007 10:09 There continues to be problems with the GCC.bm file missing from the source distribution. Looking at the structure of the file I surmise that it sets up various configuration *stuff*. I have the following questions and comments:

- *) how is it generated?
- *) when is it supposed to be generated?
- *) how does it become "stale" or out of sync?

Having this break installation should be addressed IMNSHO...

EBo --

Well, that file mostly consists of include/library paths and compiler options. It is user editable in "Build methods" dialog.

So far, I have created it long long time ago and then just copied the same file across various linux distros - it seems paths are pretty stable in fact.
