It might be possible that the SplitterFrame got stored the wrong value into config file. Either try to move the splittler or delete confing file (in .theide dir).

Mirek

Indeed

But I just noticed I can do funky things with the project directory view's splitter. I can drag any number of splitters inside the frame, like on the attached screenshot. They are gone by the next refresh and can not be moved once released, so it is quite harmless.

Guido

Interesting. Looks like repainting bug (this lines are to set number of columns; they should disappear when mouse is left).

I have briefly tested with ubuntu feisty / gnome, no problem. Any hints what could be different?

Mlrek
