That is quite unlikely - the "method" is repaint the line area after mouse-up (without the line, of course). Not sure how Beryl could influence this...

Mirek

Well, I tried under xfce4 and there behaviour is somewhat different. The line stays, when I release the button, but I can't draw multiple lines. When I drag the splitter again, the first line disappears. The screen-shot was with the not so popular EDE/edewm. I know this wm does have issues, but xfce on the other hand is quite big - a million users, or so I've heard. No. 3 X11-desktop for certain.

The splitter line is supposed to disappear, as soon as I release the mouse button on it?
Guido

Well, it is a little bit more complicated:

First of all, it is not exactly the splitter line It is just indication that you are changing the number of columns. This "indication" is drawn as light-cyan line.

Then there also is a graphical black line that separates columns. In fact, this line can be equal to "indicator" if indicator is at "exact position" - as we are setting a number of columns, only certain positions are allowed...

So if what you see as remaining is a black line, everyting is OK.

It is however rather strange as WM bug either...
