Hi fallingdutch!

I played around a little bit with https last week. Or better: I tried to.

You wrote: "openssl is already included in Upp, the only thing you have to do is enable ssl at the socket."

I use the windows installer version of upp - and there is no openssl anywhere. Then I thought, maybe its only included in sources (zip-file) - but there is also no openssl.

Which version of upp do you use? What should I do now to get openssl-files? It would not be a problem to get the files from openssl-site. But does it matter, which version I use?

>>> you could also have a look at the XmlRpc Server at my site (it is at the moment out of date, but a new will come soon)

I downloaded your code and it helps me to understand many things. Thanks a lot. But at the moment I'm not able to run any ssl-demo, because missing ssl-files. I got an error in WebSSL on following lines:

```
#include <openssl/ssl.h>
#include <openssl/err.h>
```
