My main focus is image editing both for photos and for creating custom video effects and transitions.

I just now discovered that wxWidgets has the same limitations. I've been working with non-commercial versions of VC6 & Qt3, and they remind me of that fact every time I run a program, and Qt doesn't have the same limitations. I realize that is commercial venture.

I guess it's either go back to Qt, or write the line-drawing routines. It's just that it doesn't give me as much pleasure as figuring out how Digital Image Pro does AutoFix Levels. I think mine is better, theirs often has a blue cast.

When might that proposed special package appear?

Thanks for your help.
