Hi,

Seems long and not so easy to understand how all that works... And Firebird is more complete than MySQL and SQLite, with transactions, stored procedures, triggers and so on. So, I have also to look at Oracle implementation to see how to make a good interface...

Unfortunately, when several packages are documented, all those regarding SQL and databases are not ! Is it possible to have something, even not complete ? At least, the list of classes with their hierarchy ? And/Or some more explanations about what you try to do with databases in UPP ? I was thinking, as unodgs, that your goal was to have a database-independant interface. But I agree with Mirek that it seems difficult because of the many differences between RDBMS... So, I don't understand very well yet what must do the interface ?

In others words, I don't understand yet how to get started to do that ! Some more advices, if possible, will be welcome !

PS : I'm downloading undog's interface for PostGreSQL. Maybe it will help me to understand... I'll see tomorrow
