PRIMARY KEY ("KEY1, KEY2, ...")
It seems logical, and I don't see any ambiguity ? But maybe I don't know enough yet about all consequences in upp...

There is already macro PRIMARY_KEY for single column primary keys. Well, in theory, it could be replaced by this new macro, but

a) as single-column primary keys are so much widely use, having it as special case is a good idea

b) would break all of my commercial stuff...
