Subject: QtfRichObject problem

Using U++ 207.1rc2

Modified the code QtfDrawing to try to create several drawings to be pasted into a single qtf file.

Created an array of :

RichObject ft[MAXVAL];
DrawingDraw tw[MAXVAL];

and Created them to size:

 tw[i].Create(width, height);

Drawing into the space all works OK.

Then saved the RichObject after drawing with:

ft[i]=CreateDrawingObject(tw[i].GetResult(), ...)

Now I try to create a QtfRichObject with

QtfRichObject pict(ft[i]);

and convert it to string by
 tree << "[i2000 " << pict << "]&";

Going round the loop several times creates the necessary number of objects but they are all the last one.

I am sure it is the fact that I have only one QtfRichObject pict
created and it uses that one several times in the physical draw.

I cannot make an array of QtfRichObjects to save away and I am reluctant to use new / pointers

Any suggestions please.
