Thanks for your help! Step for step it works. The problem was "URL". When I assign values manually (Port, Host, ...) it works. Now I have to pack all the stuff into a thread, because I don't want the application to freeze. I know the solution in from forum with the callback in execute - but it's not really fluid.

You are welcome. We are working on a better solution for that at the moment (have a look at the discussion in technology)

Is there any way to read values out (certid, cn, ...) of server certificate? I can't find any method to do this.

As far as I remember (without checking the code) there is none, so you need to use the openssl primitive functions, you will have to search at OpenSSL

Bas
