Hi fallingdutch!

>>> As far as i remember (without checking the code) there is none, so you need to use the openssl primitive functions, you will have to search at OpenSSL

I found some functions in WebSSL.h to read data out of certificate. After testing a while its easy (and still implemented).

I put an example here for others:

client.socket.GetInfo(SSLInfoCertSubjectName()).ToString();

All other certificate related types can be found at bottom of WebSSL.h. The information must be read after SSLClientSocket() but before Execute()!

Thanks a lot again. I will continue work on my program at weekend - maybe I will post here again in a few days

WebChaot.
