This is a bug/problem with Core function StrToDate. Specifically the problem is with the code:

```
if(IsDigit(*s)) {  
    char *q;  
    n = strtoul(s, &q, 10);  
    s = q;  
}
```

This normally reads the next number from the string s and stops when it encounters a non-digit char. When the date format doesn't include any non-digit characters it will just convert the whole string into a number, when the code that follows expects it to be a day, month or year number.

I can't see a workaround besides using non-digit characters as separators. luzr?
